

FLOOR CENTER WITH PHASE LOAD MEASUREMENT IMKK- HUB 63A/VM

The center has meters that monitor the load of each of the three phases. The phase-specific meter measures current and voltage. In addition, the meter acts as an indicator light, which indicates that current is coming to the phase. Thanks to step-by-step measurement, it is possible to monitor the even distribution of the load between the phases on the construction site, avoid skewed loads and thus prevent unnecessary phase overloads and tripping of fuses.

The narrow shape of the center is designed so that the center takes up as little space as possible in the corridors of the construction site. The center is made of 2mm powder-coated aluminum and has a light structure. The center is easy to hang on the wall from the hanging loops.

In the IMKK center, the supply takes place via a plug-in switch from the bottom of the center and chaining through to the next floor from the top of the center.

The center is manufactured in Finland and uses only high-quality European components such as PCE and Schneider. All parts of the center are available as spare parts. Changes can also be made to the center according to the customer's wishes, e.g. the number and size of the boxes can be modified.

SKU: 5000332/VM

TECHNICAL ATTRIBUTES

Nominal Current	63 A	Dimensions (H x W x D)	95 x 30 x 22 cm
Nominal voltage	400 V	Suojausluokitus	IP44
RCD	2 x 30mA, 1 x 300 mA	Weight	13,4 kg
Socket outlets	6 x 16A/230V suko, 2 x 16A, 1 x 32A	Model	IMKK-HUB 63A/VM
